Suicide rate in Netherlands

Suicide rate in Netherlands

between 2007-2012
(male: female = 2.2:1)

2012 :
16.754.961)citizens

2007 : peak economy,
lowest suiciderate since
1970

2012

- **1.753 suicides**
- Increase 106 suicides
(6.0% corrected)

Dutch men/female ratio since 2007

Suicides in the Netherlands

- Total population: 10.5/100.000
- Exclusive MH patients: $\approx 6-7/100.000$
- MH Patients: $\approx 80-90/100.000$

Background I

Mental health population

- Of all dutch suicides 40-44% in mental health
- High risk group
- Information is detailed described (inspectorate)
- Selection of a subgroup of suicides?
- General population male: female = 2.2:1
- male: female more equal (49:51% in treatment)
- Taxation 20% “fail” in mental health

Andrés (2010) *Eur. J. Public Health*

Ping Qin (2003) *Am. J. Psychiatry*

Huisman (2009) *Psychiatric Services*

Gilissen (2013) *Epidemiologisch bulletin*

Background II

Suicides in general population:

- Men more often single
- Men with job: protective.
- Unemployment en low income: increased risk for men
- Having (young) children protective for women vrouwen
- Female with “important job” and high income seem to have an increased risk
- Psychiatric illness by female: increased risk

Aim

- Gaining insight about suicides in mental
- Gaining insight about a high risk group
- Description general characteristics
- Developing a gender risk profile

Methods I

- In treatment Parnassia Groep region The Hague
- “Monopolist” in region
- january 1999 - january 2013
- Retrospective patient records and inspectorate reports (n = 314)
- Extensive database

Inspectie voor de Gezondheidszorg
Ministerie van Volksgezondheid,
Welzijn en Sport

Methode II statistics

- SPSS 20
- Chi-Square Test: categorical variabels
- T-tests: continues variabels.
- In case of small samples or poor distribution the Fishers's Exact test

Results I

			
Ratio	1.5	1	
Number	189	125	<0.001
Average age	48.4	45.8	0.149
Relationship	42.8%	47.9%	0.731
Married	29,7%	22,9%	0.196
Unmarried	51.4%	41.5%	0.096
Divorced	15.4%	27.1%	0.014
Widow(er)	3.4 %	8.5%	0.062
Children	40.0%	43.3%	0.590

Results I

Results II

Male

- 2 times ↑ alcohol problem ($p=0.002$)
- 2 times ↑ drug problem ($p=0.003$)
- 2 times ↑ work-related problems ($p < 0.001$)
- 2 times ↑ living-related problems ($p=0.030$)
- 3 times ↑ problems with justice ($p=0.038$)

Results II

Results III

Female

- 3 times ↑ cluster B ($p < 0.001$)
- 2 times ↑ physical abuse ($p=0.004$)
- 7 times ↑ sexual abuse ($p < 0,001$)
- 1,5 times ↑ emotional neglect ($p=0.003$)
- Treatment history (14 years vs 11 years) ($p=0.007$)
- ↑ suicide attempts (71% vs 53%) ($p=0.001$)

Results III

Conclusion

- Male:female ratio more equal in MH
- Male ↑ drugs/alcohol and/or axis IV problems
- Female ↑ traumatised and/or cluster B problems

Strength & limitations

+

- Numbers
- Detailed & controlled information for suicides in MH
- Large MH region and exclusive in third city of

-

- Dutch Inspectorate for health (defensive)
- No controls general population
- Different regulations inspectorate from 2010

Discussion

- Men and Female gender ratio unknown (emergency P 51 vs 49%)
- During risk taxation, gender related risk assessment?
- Shift in taxation?
